

LEARN AT CHESTERZOO

Palm Oil is used in a range of very different products around the world: in foods (10%); industrial applications (25%); bioenergy (5%)

Lots and lots of palm oil is produced each year so much so it is measured in millions of tonnes Let's try to think what that looks like in real life and then mathematically.

If 100 MT of palm oil is produced in the world each year,

How much (in MT) is used for food?

How much (in MT) is used for industrial applications?

How much (in MT) is used for bioenergy?

If 70 MT of palm oil is produced in the world each year,

How much (in MT) is used for food?

How much (in MT) is used for industrial applications?

How much (in MT) is used for bioenergy?

In fact, in 2018 there was 71.74 MT of palm oil produced across the world, so approximately

How much (in MT) is used for food?

How much (in MT) is used for industrial applications?

How much (in MT) is used for bioenergy?
